DBMS Languages

Data Manipulation Language (DML)

Two classes of languages

Procedural (Low Level)

- User specifies what data is required and how to get those data
- Example: **Relational Algebra.**
  - In RA, we specify the order in which the operations have to be performed.

Nonprocedural (High Level)

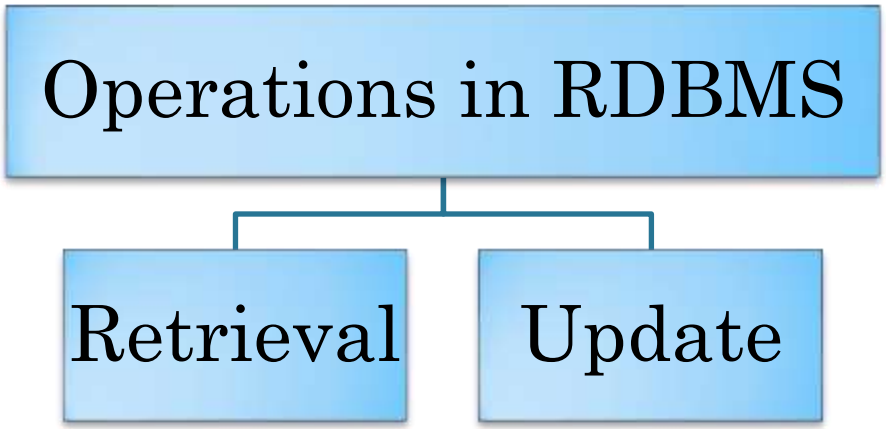
- User specifies what data is required without specifying how to get those data
- Example: **SQL**

SQL can be

- used in a standalone way (query language)
- embedded in a programming language (host language)

Relational Algebra

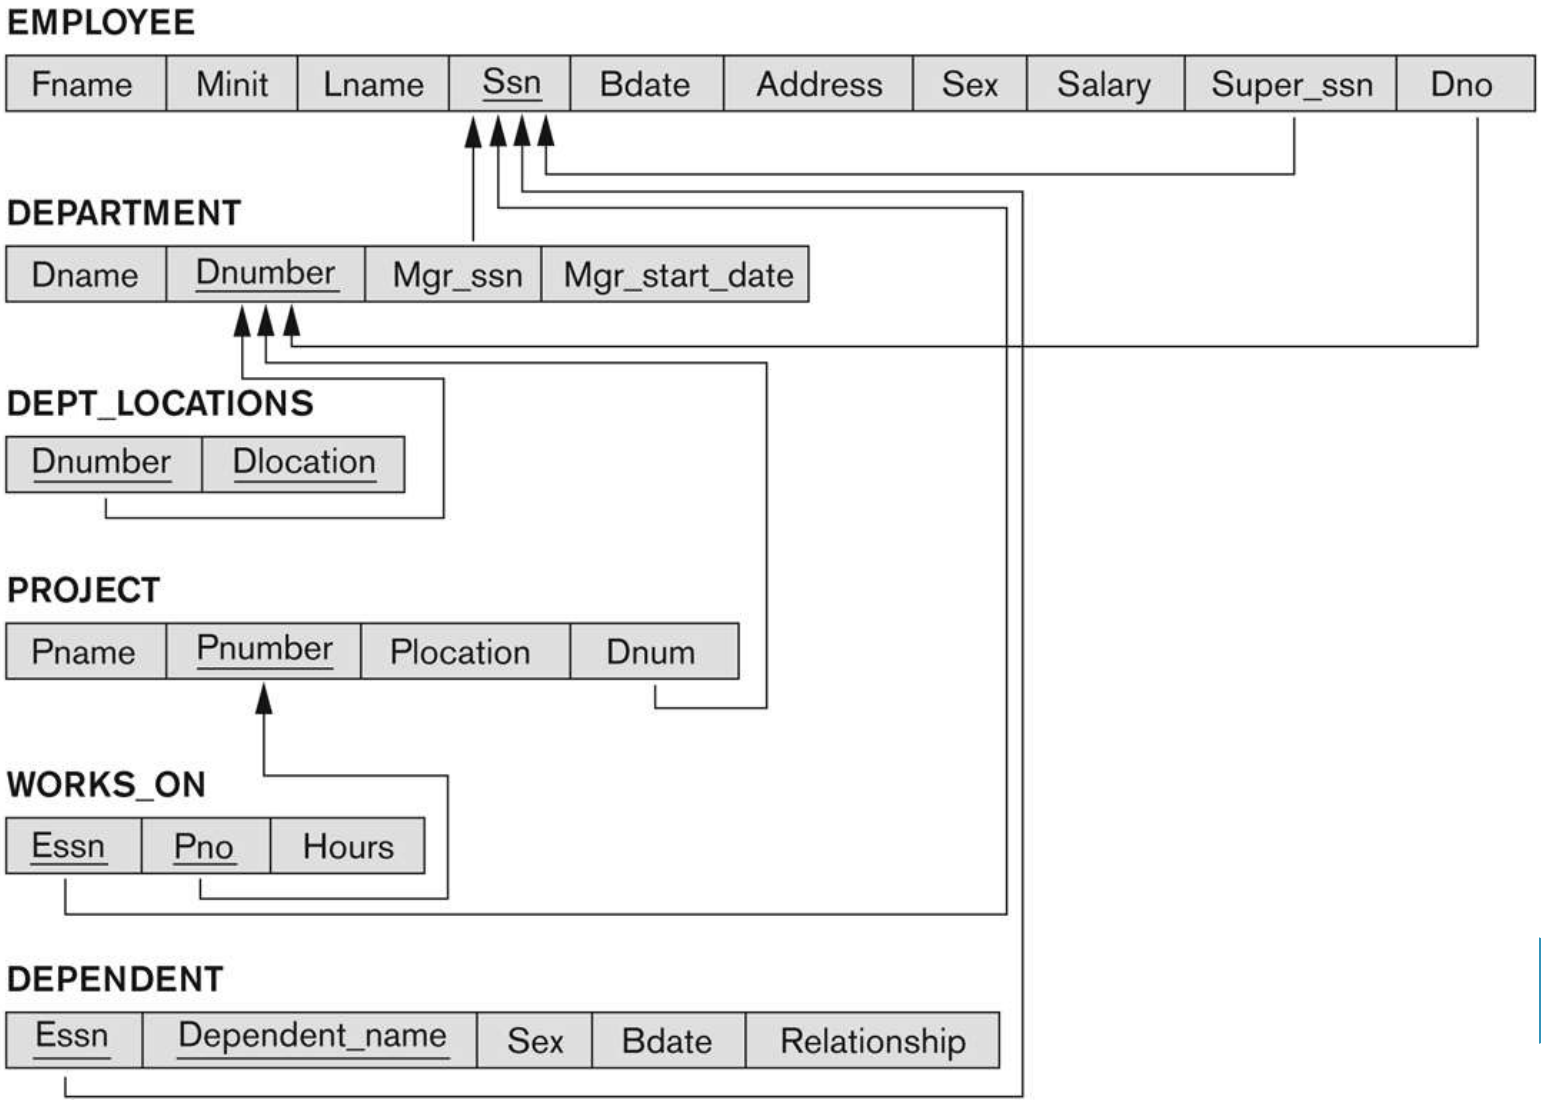
Relational Algebra



Relational Algebra is a set of operations for specifying ***retrieval requests (or queries)*** in relational model

Relational algebra expression is a sequence of relational algebra operations

Company Database



Select Operation(unary operation)

This operation selects a subset of tuples from a relation that satisfy a selection condition.

Select is denoted by : $\sigma_{\text{<selection condition>}}(R)$

EMPLOYEE

Select Operation

- **Selection condition** is a Boolean expression specified on the attributes of relation **R**
  - It can include boolean operators **AND, OR, NOT** applied on relational operators **< , > , <= , >= , != , =**

- **Select σ is commutative:**

  $\sigma_{<condition1>}(\sigma_{<condition2>}(R)) = \sigma_{<condition2>}(\sigma_{<condition1>}(R))$

- **Cascade of Select operations**

  $\sigma_{<cond1>}(\sigma_{<cond2>}(\sigma_{<cond3>}(R))) = \sigma_{<cond1> \text{ AND } <cond2> \text{ AND } <cond3>}(R)))$

$\sigma_{(DNO = 4 \text{ AND } Salary > 25000) \text{ OR } (DNO = 5 \text{ AND } Salary > 30000)}$ (EMPLOYEE)

Fname	Minit	Lname	Ssn	Bdate	Address	Sex	Salary	Super_ssn	Dno

Jennifer	S	Wallace	987654321	1941-06-20	291 Berry, Bellaire, TX	F	43000	888665555	4
Ramesh	K	Narayan	666884444	1962-09-15	975 Fire Oak, Humble, TX	M	38000	333445555	5

Project Operation (unary operation)

- It selects a subset of columns from the relation.
- denoted by $\pi_{<\text{attribute list}>}R$

Example:

- π LNAME, FNAME, SALARY (EMPLOYEE)

It removes **duplicate tuples**

The result of project is set of tuples

OUTPUT

James	E	Borg	888665555	1937-11-10	450 Stone, Houston, TX	M	55000	NULL	1

Project Operation

- **Project operation is *not* commutative**

- **$\pi_{\text{<list1>}}(\pi_{\text{<list2>}}(R)) = \pi_{\text{<list1>}}(R)$ as long as <list2> contains the attributes in <list1>**

No of Tuples in the result of projection $\pi_{\text{<list>}}(R)$ is less or equal to the number of tuples in R

If the list of attributes includes a *key* of R, then the no of is *equal* to the no of tuples in R

Print the name and number of projects offered by department 5

Relational Algebra Expressions

Retrieve the first name, last name, and salary of all employees who work in department number 5

Single relational algebra expression:

- $\pi_{\text{FNAME, LNAME, SALARY}}(\sigma_{\text{DNO=5}}(\text{EMPLOYEE}))$

Using intermediate relation:

- $D5 \leftarrow \sigma_{\text{DNO=5}}(\text{EMPLOYEE})$
- $\text{RESULT} \leftarrow \pi_{\text{FNAME, LNAME, SALARY}}(D5)$

Example of applying multiple operations and **RENAME**

$\pi_{FNAME, LNAME, SALARY}(\sigma_{DNO=5}(EMPLOYEE))$

Fname	Lname	Salary
John	Smith	30000
Franklin	Wong	40000
Ramesh	Narayan	38000
Joyce	English	25000

$D5 \leftarrow \sigma_{DNO=5}(EMPLOYEE)$

$R\ (First\_name, Last\_name, Salary) \leftarrow \pi_{Fname, Lname, Salary}\ D5$

D5

Fname	Minit	Lname	Ssn	Bdate	Address	Sex	Salary	Super_ssn	Dno

Joyce	A	English	453453453	1972-07-31	5631 Rice, Houston,				

R

First_name	Last_name	Salary
John	Smith	30000
Franklin	Wong	40000
Ramesh	Narayan	38000
Joyce	English	25000

CARTESIAN PRODUCT

- The result of Cartesian product of two relations

  R(A1, A2, . . ., An) x S(B1, B2, . . ., Bm)

  is given as:

  Result(A1, A2, . . ., An, B1, B2, . . ., Bm)

- Let $|R| = n_R$ and $|S| = n_S$, then $|R \times S| = n_R * n_S$
- R and S may NOT be "type compatible"

Cross Product is a meaningful operation only if it is followed by other operations

Print the details of the manager of each department

JOIN(Binary Operation)

- JOIN denoted by ⋈ *combines related tuples* from various relations
- JOIN combines CARTESIAN PRODECT and SELECT into a single operation
- General form of a join operation on two relations R(A1, A2, . . ., An) and S(B1, B2, . . ., Bm) is:

$$R \bowtie_{\text{<join condition>}} S$$

Problem: Retrieve a list of each female employee's dependents

Jennifer	Wallace	Abner

Some properties of JOIN

Consider the following JOIN operation:

- **R(A1, A2, . . ., An)** $\bowtie_{R.Ai=S.Bj}$ **S(B1, B2, . . ., Bm)**

- Result is a **relation Q** with degree n + m attributes:
  Q(A1, A2, . . ., An, B1, B2, . . ., Bm), in this order.

- If R has n_R tuples, and S has n_S tuples, then no of tuples in join result $< n_R * n_S$.

Equi-Join

- EQUIJOIN is a join condition that involves only equality operator = .
- **Example:**
  - **Retrieve a list of each female employee's dependents**

$$FEmp \leftarrow \sigma_{SEX='F'}(EMPLOYEE)$$

$$E\_DP \leftarrow FEmp \bowtie_{SSN=ESSN} DEPENDENT$$

$$Result \leftarrow \pi_{FNAME, LNAME, SSN, DEPENDENT\_NAME}(E\_DP)$$

This is EQUI -JOIN operation

Retrieve the name of the manager of each department

NATURAL JOIN Operation

- **Example:** Print location of each department

  DEPT_LOCS ← DEPARTMENT * DEPT_LOCATIONS

- Only attribute with the same name is **DNUMBER**

An implicit join condition is created based on this attribute:
DEPARTMENT.DNUMBER=DEPT_LOCATIONS.DNUMBER

DEPARTMENT

Dname	Dnumber	Mgr_ssn	Mgr_start_date
Research	5	333445555	1988-05-22
Administration	4	987654321	1995-01-01
Headquarters	1	888665555	1981-06-19

DEPT_LOCATIONS

Dnumber	Dlocation
1	Houston
4	Stafford
5	Bellaire
5	Sugarland
5	Houston

NATURAL JOIN Operation

- **Example:** Print location of each department

  DEPT_LOCS ← DEPARTMENT * DEPT_LOCATIONS

- A

DEPT_LOCS

5	Houston

Issue with Equijoin Operation

- You have to specify the **join condition.**
  - Even if two cols in the joining tables have same name.

DEPT_MGR

Dname	Dnumber	Mgr_ssn	...	Fname	Minit	Lname	Ssn	...
Research	5	333445555	...	Franklin	T	Wong	333445555	...
Administration	4	987654321	...	Jennifer	S	Wallace	987654321	...
Headquarters	1	888665555	...	James	E	Borg	888665555	...

- Superfluous column
- Result of EQUIJOIN always have one or more pairs of attributes that have identical values in every tuple.

NATURAL JOIN Operation

NATURAL JOIN operation (denoted by *) is used when

- the two join attributes, or
- each pair of corresponding join attributes

must *have the same name* in both relations

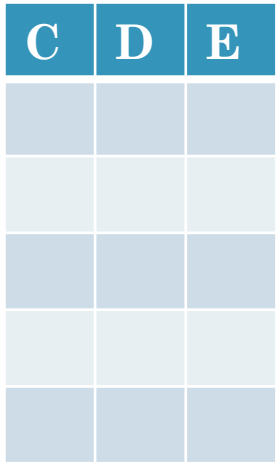
- If this is not the case, a renaming operation is applied first.

- NATURAL JOIN also get rid of the superfluous attribute in an EQUIJOIN condition.

Example: Natural Join

- Consider two Relations
  - **R1(A,B,C,D) & R2(C,D,E)**

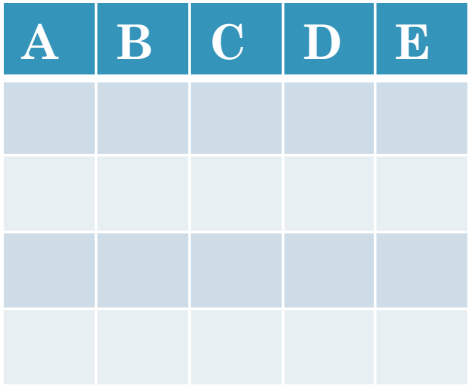
R1



R2

- Natural Join R*S
  - **RES ← R1(A,B,C,D) * R2(C,D,E)**
  - The implicit join condition
    - **R1.C=R2.C AND R1.D=R2.D**

RES(A,B,C,D,E)



Theta-join

- The general case of JOIN operation is called a **Theta-join:** $R \bowtie_{theta} S$
- ***Theta*** is a boolean expression on the attributes of R and S; for example:
  - R.Ai<S.Bj AND (R.Ak=S.Bl OR R.Ap<S.Bq)
- Theta-join can have any comparison operators

$$\{=, \neq, <, \leq, >, \geq\}$$

Theta-join Example

For each Male employee, list his colleagues who earn more than him. Retrieve only the first name and salary.

$M(Name, Sal) \leftarrow \pi_{\mathbf{FNAME,\ SALARY}} (\sigma_{SEX='M'} EMPLOYEE)$

$ECOL(CName, CSal) \leftarrow \pi_{\mathbf{FNAME,\ SALARY}} EMPLOYEE$

$R1 \leftarrow M \bowtie_{M.Sal < ECol.CSal} ECol$

EMPLOYEE

Fname	Minit	Lname	Ssn	Bdate	Address	Sex	Salary	Super_ssn	Dno
John	B	Smith	123456789	1965-01-09	731 Fondren, Houston, TX	M	30000	333445555	5
Franklin	T	Wong	333445555	1955-12-08	638 Voss, Houston, TX	M	40000	888665555	5

Union (Binary Operation)

- The result of R ∪ S, is a relation that includes all tuples that are either in R or in S or in both R and S
- **Duplicate tuples are eliminated**

Type compatible (Union compatible)

- The two relations R and S must be **Type compatible**
  - R and S must have same number of attributes
  - Each pair of corresponding attributes must have same or compatible domains

Fname	Lname	Salary
John	Smith	30000
Franklin	Wong	40000
Ramesh	Narayan	38000
Joyce	English	25000

∪

Fname	Lname	Salary
John	Smith	30000
Franklin	Wong	40000

UNION Example

To retrieve the SSN of all employees who either

- work in department 5 ***or***
- directly supervise an employee in department 5

$$D5\_EMPS \leftarrow \sigma_{DNO=5}(EMPLOYEE)$$
$$RESULT1 \leftarrow \pi_{SSN}(D5\_EMPS)$$
$$RESULT2(SSN) \leftarrow \pi_{SUPERSSN}(D5\_EMPS)$$
$$RESULT \leftarrow RESULT1 \cup RESULT2$$

RESULT1

666884444
453453453
888665555

INTERSECTION And SET DIFFERENCE (Binary Operations)

- INTERSECTION operation: the result of $R \cap S$, is a relation that includes all tuples that are in both R and S
- SET DIFFERENCE operation: the result of $R - S$, is a relation that includes all tuples that are in R but not in S
- Two relations R and S must be "type compatible"

Relational Algebra Operations from Set Theory

- Both $\cup$ and $\cap$ are *commutative* operations
  - $R \cup S = S \cup R$, and $R \cap S = S \cap R$
- Both $\cup$ and $\cap$ can be treated as n-ary operations
  - $R \cup (S \cup T) = (R \cup S) \cup T$
  - $(R \cap S) \cap T = R \cap (S \cap T)$
- Minus operation is not commutative
  - $R - S \neq S - R$

RENAME OPEARATION

Rename operator is denoted by ρ (rho)

$D5 \leftarrow \pi_{Fname, Lname, Salary} (\sigma_{DNO=5}(EMPLOYEE))$

$\rho_{R(First\_Name, Last\_Name, Salary)}(D5)$

R

First_name	Last_name	Salary
John	Smith	30000
Franklin	Wong	40000
Ramesh	Narayan	38000
Joyce	English	25000

$D5 \leftarrow \sigma_{DNO=5}(EMPLOYEE)$

$R(First\_name, Last\_name, Salary) \leftarrow \pi_{Fname, Lname, Salary} D5$

RENAME OPEARATION

$\rho_S(R)$ rename the *relation R* to S

R

First_name	Last_name	Salary
John	Smith	30000
Franklin	Wong	40000
Ramesh	Narayan	38000

S

First_name	Last_name	Salary
John	Smith	30000
Franklin	Wong	40000
Ramesh	Narayan	38000

$\rho_{(B1, B2, \ldots, Bn)}(R)$ rename the *attributes* to B1, B2, …..Bn

R

First_name	Last_name	Salary
John	Smith	30000
Franklin	Wong	40000
Ramesh	Narayan	38000

R

F_	L	Salary
John	Smith	30000
Franklin	Wong	40000
Ramesh	Narayan	38000

$\rho_{S\ (B1, B2, \ldots, Bn)}(R)$ rename R to S & attributes to B1, …..Bn

R

First_name	Last_name	Salary
John	Smith	30000
Franklin	Wong	40000
Ramesh	Narayan	38000

S

F_	L	Salary
John	Smith	30000
Franklin	Wong	40000
Ramesh	Narayan	38000

Aggregate Functions

- Mathematical Aggregate Functions applied to collections of numeric values include
  - SUM, AVERAGE, MAXIMUM, and MINIMUM.
  - COUNT function is used for counting tuples or values.

Examples:

Retrieve the average or total salary of all employees

Retrieve total number of employee tuples

Aggregate Functions $\mathcal{F}$

- $\mathcal{F}_{\text{MAX Salary}}$ (EMPLOYEE)
- $\mathcal{F}_{\text{MIN Salary}}$ (EMPLOYEE)
- $\mathcal{F}_{\text{SUM Salary, AVERAGE Salary}}$ (EMPLOYEE)
- $\mathcal{F}_{\text{COUNT SSN}}$ (EMPLOYEE)

COUNT (*) returns the no. of rows in the result of the query ***(it counts without removing duplicates)***

NULL values are **discarded** when aggregate functions are applied to a particular column (attribute).

EMPLOYEE

Fname	Minit	Lname	Ssn	Bdate	Address	Sex	Salary	Super_ssn	Dno
John	B	Smith	123456789	1965-01-09	731 Fondren, Houston, TX	M	30000	333445555	5
Franklin	T	Wong	333445555	1955-12-08	638 Voss, Houston, TX	M	40000	888665555	5
Alicia	J	Zelaya	999887777	1968-01-19	3321 Castle, Spring, TX	F	25000	987654321	4
Jennifer	S	Wallace	987654321	1941-06-20	291 Berry, Bellaire, TX	F	43000	888665555	4

Outer Join Operation

- In INNER JOIN, tuples without a *matching* are eliminated from the join result
  - Tuples with null are also eliminated
  - This amounts to loss of information.

OUTER joins operations are used when we want to keep

- **all the tuples in R** in the join result , or
- **all the tuples in S** in the join result, or
- **all tuples in both relations R and S** in the join result

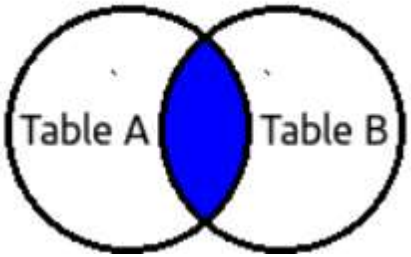
Outer Join Operation

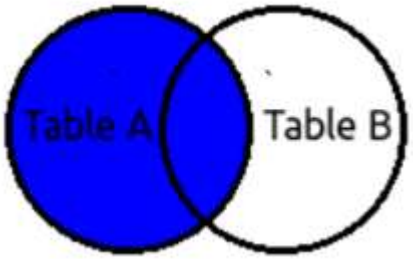
- **Left outer join**: keeps every tuple in R, denoted as R ⟕ S
  - if no matching tuple is found in S, then the attributes of S in the join result are filled with null values.

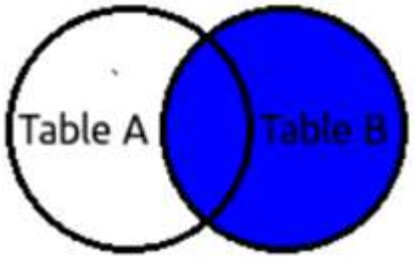
- **Right outer join:** keeps every tuple in S in the result of R ⟖ S.

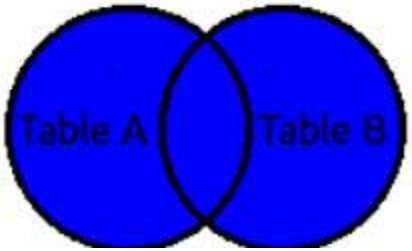
- **Full outer join:** keeps all tuples in both the left and the right relations. It is denoted by ⟗

Inner and Outer Joins









Another Example Outer Join

List the employees name and the Project name that they work on. If they don't work on any project or a project have no employee working on it, then indicate this with a null value.

PROJECT

Pname	Pnumber	Plocation	Dnum
ProductX	1	Bellaire	5

- PD4(Pno) ← π_{Pnumber} ($\sigma_{\text{DNUM=4}}$ Project)
- Ssn_Pnos ← $\pi_{\text{Essn,Pno}}$ (Works_on)
- **SSNS(ssn)← Ssn_Pnos ÷ PD4**

DIVISION

DIVISION (Binary Operation)

Division operation is applied to two relations R1 and R2

R1(Attributes_R1) ÷ R2(Attributes_R2)

- where Attributes_R2 ⊂ Attributes_R1.

Let **Result = R1 ÷ R2**

Attr_Res = Attributes_R1 - Attributes_R2

- Attr_Res is a set of attributes of R1 that are not the attributes of R2.

R2

A
a1
a2
a3

Result

B
b1
b4

R1

A	B
a1	b1
a2	b1
a3	b1
a4	b1
a1	b2
a3	b2
a2	b3
a3	b3
a4	b3
a1	b4
a2	b4
a3	b4

For a **tuple t** to appear in the result of the DIVISION, the values in t must appear in R1 in combination with *every* tuple in R2.

Example of DIVISION

Find **SSN** of employees who work on all the projects that *John Smith* works on

EMPLOYEE

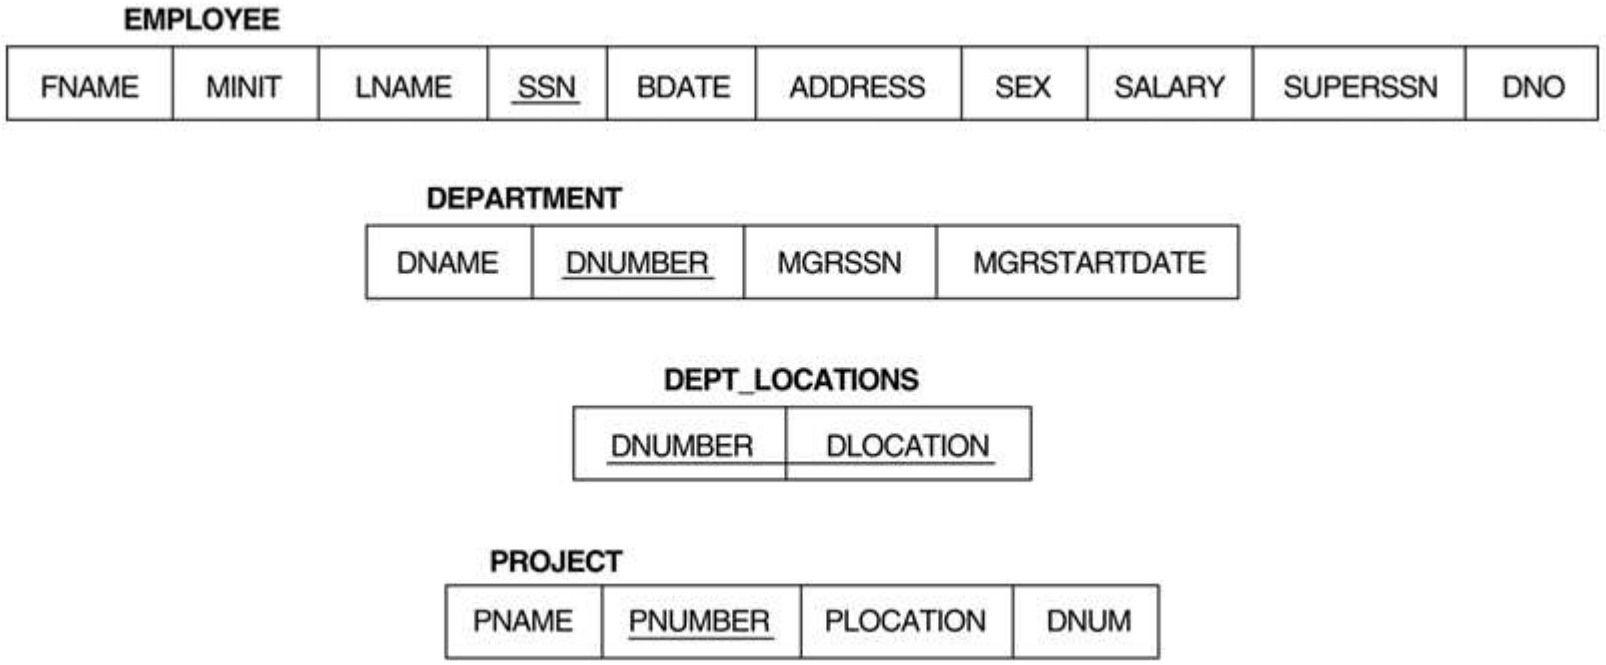
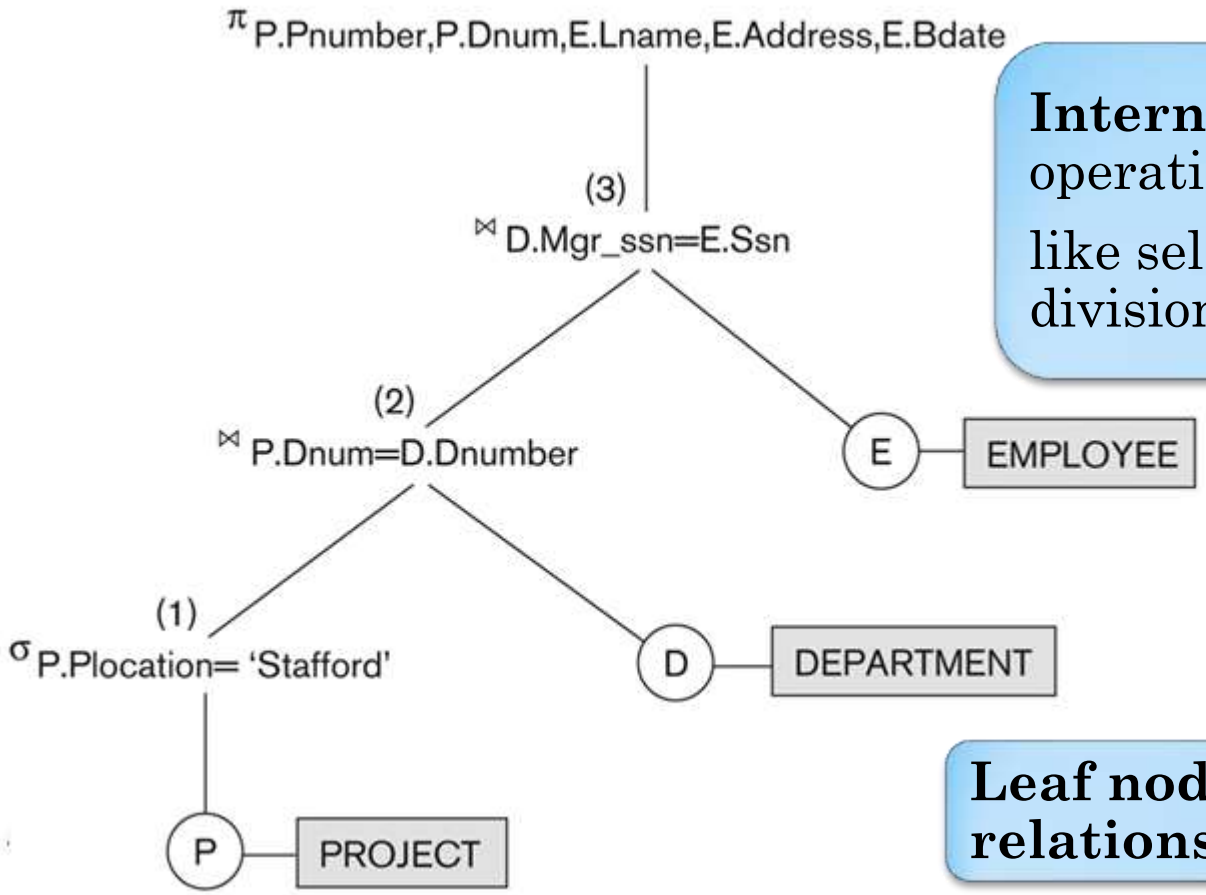
Example

For every project located in **'Stafford'**, list the **project no**, the **controlling department no**, and the **department manager's last name, address, and birth date**.



Example of Query Tree

For every project located in **'Stafford'**, list the **project no**, the **controlling department no**, and the **department manager's last name, address, and birth date**.



Internal Nodes stand for operations

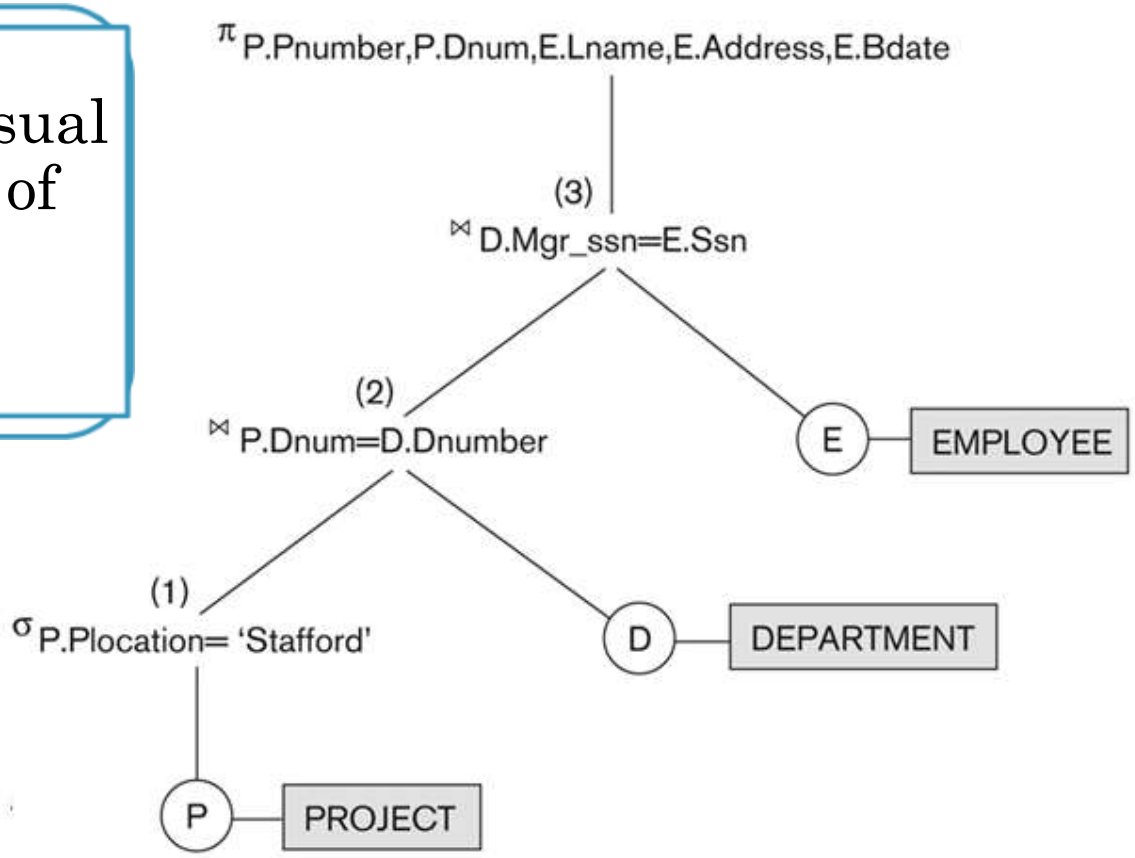
like selection, projection, join, division, ….

Leaf nodes represent **base relations**

Query Tree is an internal data structure to represent a query

Standard technique to **estimate the work done** in executing the query, and the ***optimization of execution***

A tree gives a good visual feel of the complexity of the query and the operations involved



Recursive Closure Operation

- This can't be specified in general using **Relational Algebra**
- **Example:** Retrieve all SUPERVISEES of an EMPLOYEE **e** at all levels — that is,
  - all employees **e`** directly supervised by **e**;
  - all employees **e``** directly supervised by each employee **e`**;
  - all employees **e```**directly supervised by each employee **e``**;
  - and so on.

We can retrieve employees at each level and then take their union, however, we cannot specify a query such as

"retrieve the supervisees of 'James Borg' at all levels" without utilizing a looping mechanism.

The SQL3 standard includes syntax for recursive closure.

Recursive Closure Operation

(Borg's SSN is 888665555)

	(SSN)	(SUPERSSN)
SUPERVISION	SSN1	SSN2
	123456789	333445555
	333445555	888665555

PRACTICE QUESTION

- **Do example queries and the questions at the end of Relational Algebra Chapter in**

  - *Fundamentals of Database Systems* (6th Edition), Ramez Elmasri
  - *Database Systems: The Complete Book*, Hector Garcia-Molina, Jeffrey Ullman, Jennifer Widom
  - *Database Management Systems*, Raghu Ramakrishnan

Relational Algebra Operators

- Relational Algebra consists of several groups of operations
  - **Unary Relational Operations**
    - SELECT (symbol: **σ** (sigma))
    - PROJECT (symbol: **π** (pi))
    - RENAME (symbol: **ρ** (rho))
  - **Relational Algebra Operations From Set Theory**
    - UNION (∪), INTERSECTION (∩), DIFFERENCE (–)
    - CARTESIAN PRODUCT (**x**)
  - **Binary Relational Operations**
    - JOIN (several variations of JOIN exist)
    - **DIVISION**
  - **Additional Relational Operations**
    - OUTER JOINS, OUTER UNION
    - AGGREGATE FUNCTIONS (These compute summary of information: for example, SUM, COUNT, AVG, MIN, MAX)

SQL
